

"I've had experience using tile and vinyl flooring, but Acrylicon is so much better. The reduced maintenance and cost effectiveness of the floor makes it a perfect solution for our hotel."

Stale Ims, Head Chef
Clarion Hotel, Bergen

"Following your excellent work at Bentley's I hope to be able to use your services again soon."

Cyril Lommaert, Ops Director
Bentleys Oyster Bar and Grill, London

"the floor looks fantastic against the stainless steel equipment."

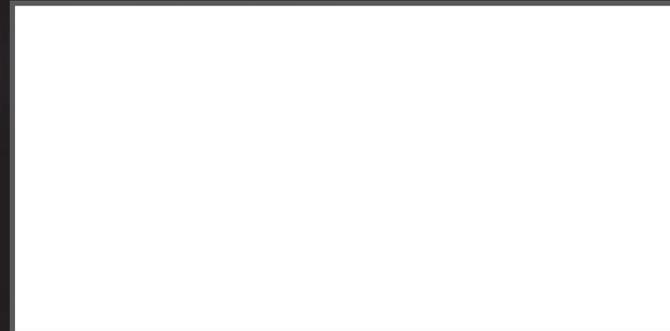

Sir Gulam Noon, Noon Products
Bombay Brasserie, London

*The best Kitchens,
demand the
best flooring
Acrylicon*

The floor you can work on in just 90 minutes!

Unbelievable but true:

Acrylicon reaches full strength and can be fully operational just 90 minutes after installation.

We know that time means money in the catering industry, and because of this Acrylicon has been leading the way in this sector for over 30 years. Our exceptional cure time means that installations and repairs can be carried out over night, with the floor being put back into FULL use just 90 minutes later. It also enables other trades to follow on much sooner, dramatically reducing project times on major refurbishments as well.

Slip resistant

The surface texture of Acrylicon can be varied to provide different degrees of slip resistance depending on the application. Even when wet and greasy, Acrylicon floors will still comply with HSE guidelines, keeping your staff safe.

Hygiene and cleaning

All Acrylicon floors are completely non-porous throughout the system. This ensures a sealed hygienic floor with no pores or pinholes in which bacteria can proliferate. Acrylicon floors have full EEC and FDA food contact approval and have a similar cleanability to stainless steel and Teflon®. Coved skirting can be provided which is truly seamless with the floor and walls, leaving no dirt traps.

Permanent bond

Unlike other resin floors, which only mechanically stick to the substrate, Acrylicon chemically fuses to it and with itself – leaving a truly monolithic system from top to bottom. With no bond lines, delamination is a thing of the past. This unique ability to chemically bond means that any repairs or extensions will chemically seal back into the floor permanently. We can also bond to tiles, wood and metal decking in some instances.

Longest lasting

Acrylicon started laying its unique flooring systems in 1977. Since then, we have not changed the formula of our resins, only improved our laying techniques. It is a testament to the chemical composition of Acrylicon that our oldest jobs are still available to view. With a true life expectancy of 4-8 times that of other vinyl or resin floors, we offer fantastic value for money. Many of our customers have carried out little or no maintenance within the first 15 years.

Microban®

With the addition of Microban® the Acrylicon floor will remain more hygienic between cleanings, 24/7 for the life of the floor. Microban® antimicrobial product protection is effective in inhibiting the growth of microbes, such as bacteria and mould that can cause stains, odours and deterioration of the floor. Microban® protection is built in during the manufacturing process designed to last the lifetime of the floor.
